### Presentation and goals

The first national seminar on the valuation of natural resources and the environment aims to situate scientific questions at the level of functional systems encompassing biodiversity, food security, climate change, and sustainable development. It is a question of proposing management solutions that require models which apprehend the combinations of its aspects within human societies in their environment. Therefore, in a vulnerable environment, efficient valuation requires specific methods of exploitation of the resource, by monitoring the agroecosystem that it is a question of building and adapting. While ecosystems are deteriorating under the effect of exploitation mechanisms and climate change, the impacts generated by increasing human pressure and the lack of conservation of the resource, participatory planning focusing on the individual as an actor, combined with a technology adapted to the context; this helps to improve the sustainability of development. Under this outline is conceived the objective of this seminar.
